Performance-based Testing of Mediators (a lightning-speed tour)

Christopher Honeyman
Convenor Conflict Management
September 2009
Long, long ago (1984) in a galaxy far, far away...
In a world of its own...

the only place in the known universe where every mediator was also an arbitrator and an administrative law judge...

Chicago is that way...
...there was a hardy band of mediators.

- A long-established mediation culture: by 1936, this group was already at work.
- By 1984, there was a recognition that existing selection methods had produced inconsistent results.
- Was it possible to do better?
  - If a study could be designed to let an observer
    - watch some good, but very different, mediators
    - in cases selected to be as similar as possible
  - Some common factors might be deduced.
The cases studied shared a number of characteristics, and were all in the same geographic region, about 100 miles in each direction.

Target area:
About 10,000 square miles.
Five mediators studied (out of 20+)

- Mediators were selected according to conventional ideas of “good”
  - High settlement rate
  - High acceptability to parties
  - High reputation among peers

- And within that:
  - Maximum possible variance among approaches and character

- Case assignments were structured to give these five mediators the closest workable equivalent to the *same case*, over and over.
Initial results
(Honeyman, C., “Five Elements of Mediation”
*Negotiation Journal*, April 1988)

- Central finding: all five mediators were showing the same skills---but in very different ways.
- Key conclusion: a rebuttable presumption that these skills were central to effective mediation *in the setting studied.*
Subsequently:

- **Practical effects:**
  - A new way of directing training toward individual skills
  - A new way of examining mediators, using actors in role plays where the candidate plays the mediator
    - First round: 1987, Wisconsin, labor mediators, for State of Wisconsin
    - Second round: 1989, Boston, commercial mediators, for the Superior Court mediation program
    - Since then: Many variations, including CEDR (London), San Diego Mediation Center, Family Mediation Canada, Bar Association of New South Wales (Australia), United Airlines and U.S. State Dept. internal mediation programs, etc.
What does “good” really mean?

- Definitions of “good” skill and ability in mediation have a **cultural component**.
- Evaluation scales developed for one setting **must be re-examined** for any other, and tailored where necessary.
- For IMI, a balance is necessary:
  - Too much standardization robs tests of cultural validity
  - Too little runs up costs and threatens inconsistent levels of proficiency.

*Croatian adaptation of several scales (2002)*

Formular za ocjenu rada miritelja ¹

Sedm pokazatelja djelatnosti: A) istraživanje, B) empatija, C) inventivnost i rješavanje problema, D) sposobnost uvjeravanja i prezentacije, E) odvajanje pozornosti, F) rukovođenje interakcije, G) dublje znanje. Koristite protor uz svaki od pokazatelja pri ocjenjivanju miritelja kojeg promatraste. Zaokružite odgovarajući broj i navедite pojašnjenje.

A. Istraživanje: Učinkovitost pri identificiranju i prihvaćanju informacija od važnosti za određeni slučaj:
1. Postavljena većinom nevažna pitanja
2. Postavljena oštećena pitanja
3. Postavljena mnogošrojnja važna i pronikljiva pitanja, posebno na početku postupka

B. Empatija: Primjetno razumijevanje i svijest o potrebama ostalih
1. Postavljeno niz nepoštovanih, zbunjujućih, pristrašnih pitanja
2. Slikanje drugih bez izražavanja antagonizma
3. Izbjegavanje negodovanja ili favoriziranja na štetu ili u korist bilo koje strane

C. Inventivnost i rješavanje problema: Potraga za rješenjima na temelju suradnje stranaka, te omiljavanje ideja i prijedloga vezanih za slučaj i korisnih za stranke u sporu
1. Fenomen preuzimanog donošenja rješenja, zaključujući prije utvrđivanja esencijalnih članjena
2. Uvažavanje nekih prijedloga i pristanak na kompromisne obzirem na drugu stranu
3. Izbjegavanje donošenja odluka na samom početku procesa
Example 1: Wisconsin

- Four scales, used for evaluating *trainee* mediators:
  - Investigation
  - Empathy
  - Persuasion
  - Invention

- Original scales presumed mediators would be
  - new to the field
  - assertive, to avoid wasted time
    - mediators had heavy caseloads---and were not paid by the hour.

- Some qualities deliberately omitted from testing, as impractical or too much to expect from trainees
Example 2: Boston courts

- Mediator candidates in Boston were expected to be experienced, and able to take on vigorously disputed Superior Court commercial cases with minimal training
- “Managing the Interaction” was added to the Wisconsin evaluation scales
- “Distraction” was incorporated into “Managing the Interaction”
- Various other detail changes
Example 3: Test Design Project

- 1990-1995 project, with many participants including representatives of federal and state courts, federal and state government, academia, private practice and membership organizations
- U.S. National Science Foundation supported a project feasibility study, conducted by two leading testing organizations (AIR and HumRRO)
  - Reported conclusions:
    - Performance-based testing of mediators was scientifically feasible
    - But it was not *politically* feasible within the field, at that time.
Example 3, continued: Test Design Project

- Numerous changes to scales by 1995, e.g.
  - “Gathering information” replaced “Investigation”
  - “Empathy” separated from “Impartiality”
  - “Inventiveness” redefined as “Generating Options”
  - “Persuasion” redefined as “Generating Agreements”
  - A new subset added of “Variant 2” scales, designed for “transformative” mediation
Example 4: Penn SEMS

- A Pennsylvania statewide special education mediation program; 20 mediators, all of whom were already employed; group wanted to rethink quality
- New scales drafted, by C. Honeyman and Penn SEMS director Grace D’Alo
  - One objective: to allow for the coexistence of “facilitative” and “transformative” mediators within the same program.
Conclusion: In Designing Mediator Evaluation Scales, Culture Matters

- The variations described here all took place within what most people think of as *the same culture* (US mainstream.)
- Beyond US culture, the variations are certainly greater.
- They can only be determined
  - country by country (or smaller scale)
  - primarily by a local committee
    - though experts can assist.
